Übung Nr. 3  
Implementing Validation

Aufgabe 1

---

Use the `@ModelAttribute` to receive data from a Student (name, email, birthdate) form in the Controller, mapping the form in the view with each attribute of the Student class.

Aufgabe 2

---

Use `@Valid`, `@NotBlank` and `@Size` to validate the Student class and show the error messages in the proper view.

Aufgabe 3

---

- 3.1 Create a subpackage “validator”.
- 3.2 Create a custom validator for the “Student” Class using the interface `Validator`. Import the necessary dependencies for the `Validator`.
- 3.3 Register your `Validator` by the `StudentController`

Aufgabe 4

---

Create a `message.properties` file to save the messages used to validate the Entity Student.
